## Bistable perception:

Spontaneous transitions between two mutually exclusive perceptual states (Leopold et al. 2002).

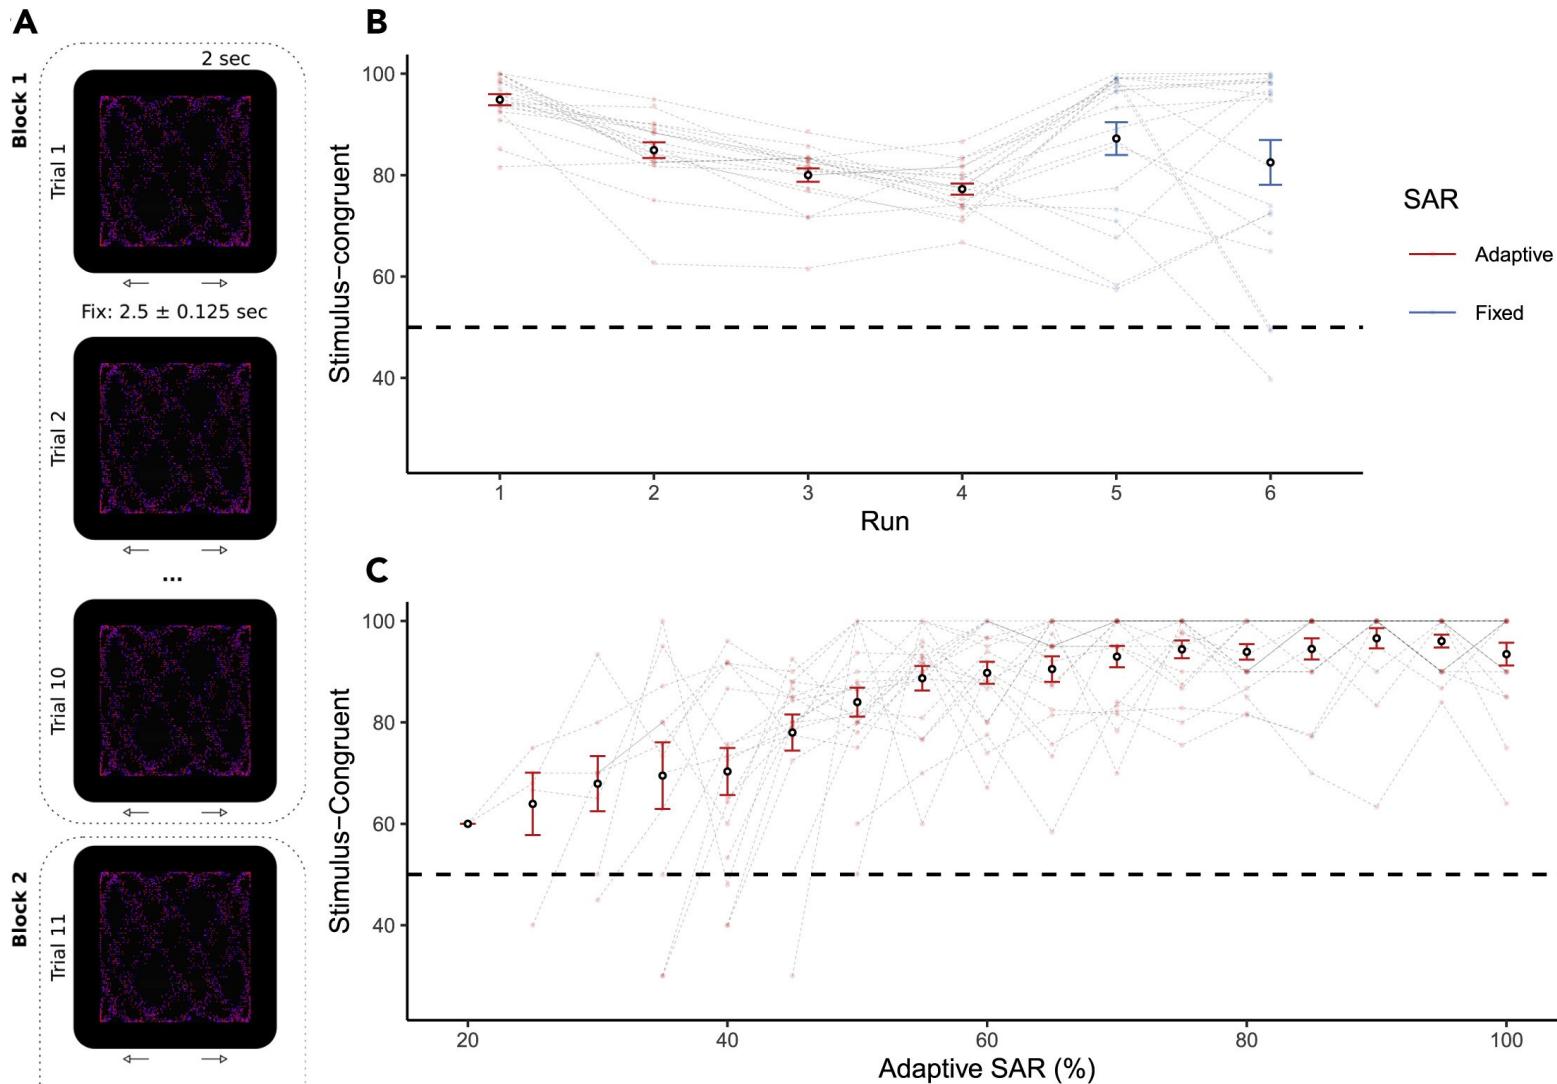

## Intermittent presentation:

Conscious experience is stabilized by perceptual history (Maloney et al. 2005, Pearson & Brascamp 2008).

## Graded ambiguity:

How strong is perceptual history relative to the stimulus' signal-to-ambiguity ratio?

# Perceptual History vs. Signal-to-Ambiguity

**Stimulus-congruence:**  
Perceptual state matches stimulus information.

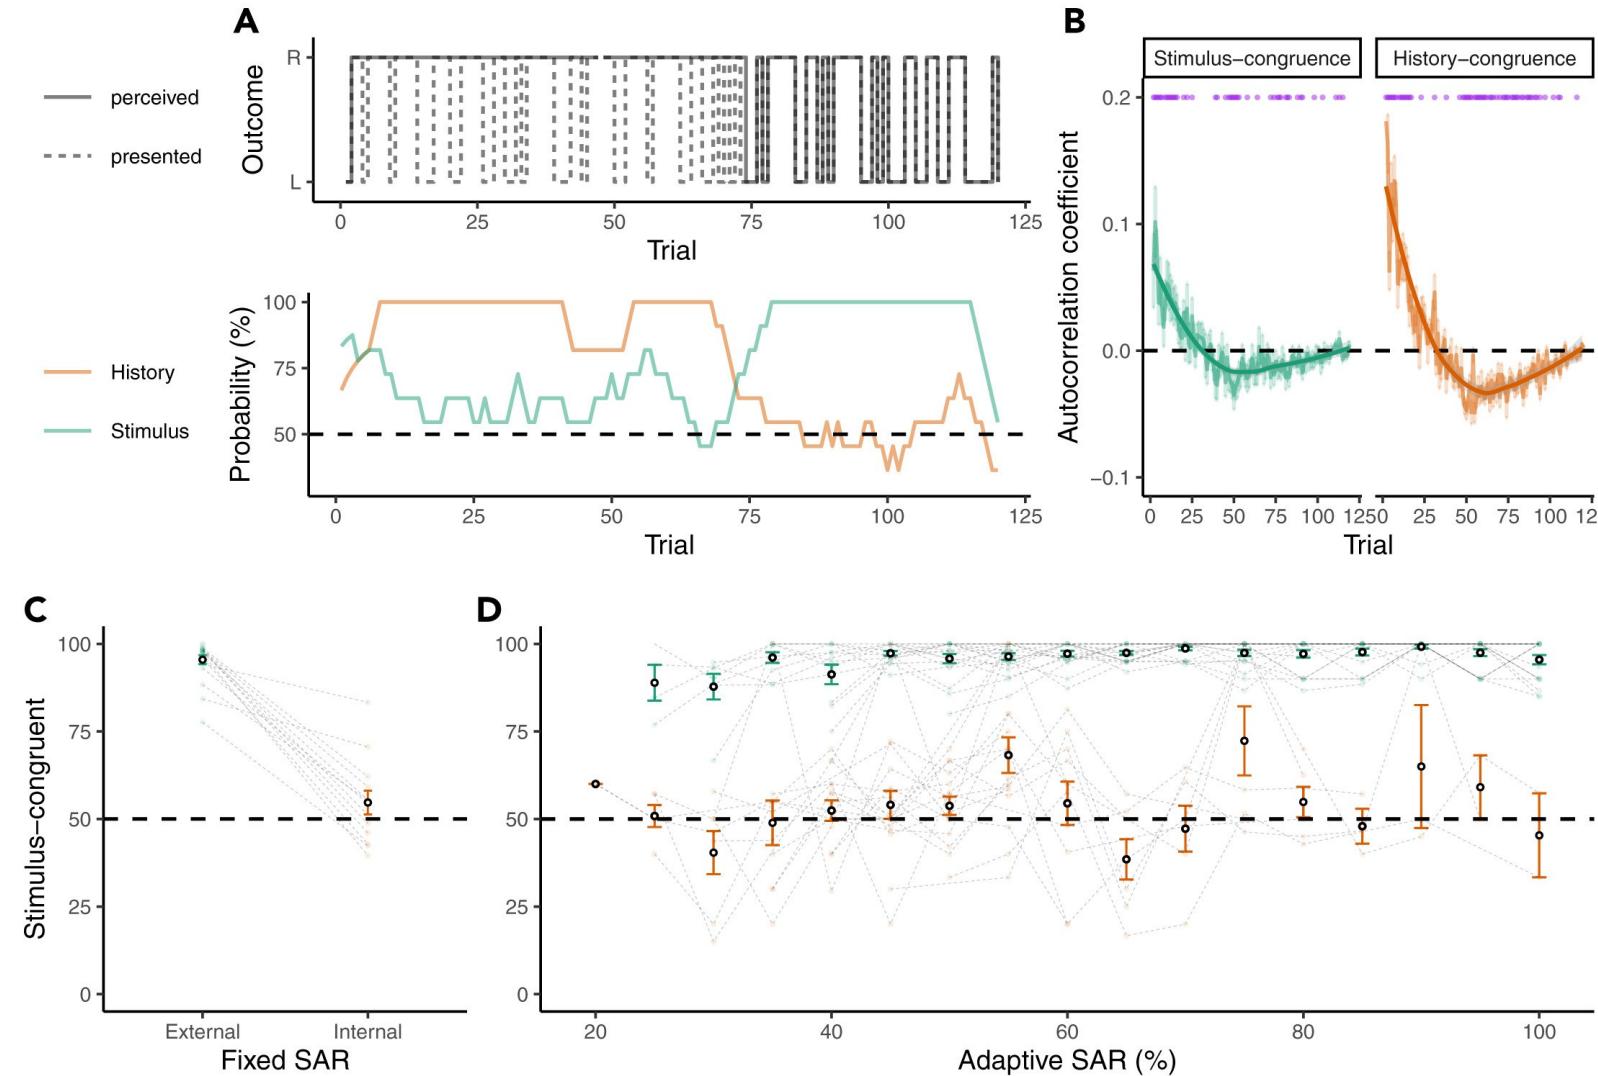

**History-congruence:**  
Perceptual state matches preceding perceptual state

**Psychophysical staircase:**  
SAR adjust the balance between stimulus- and history-congruence

## Fixed SAR:

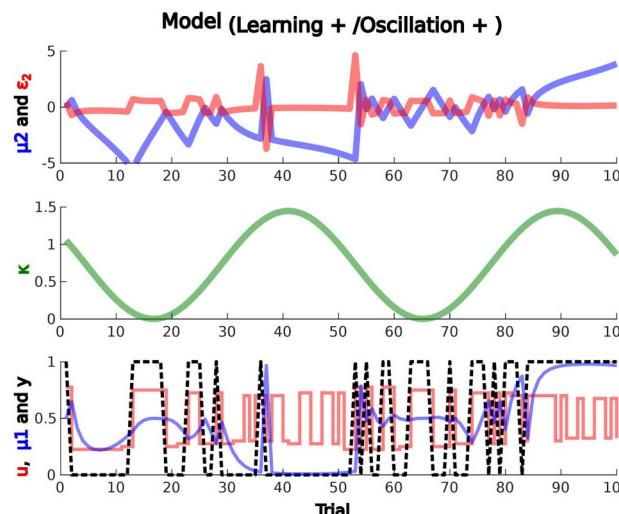

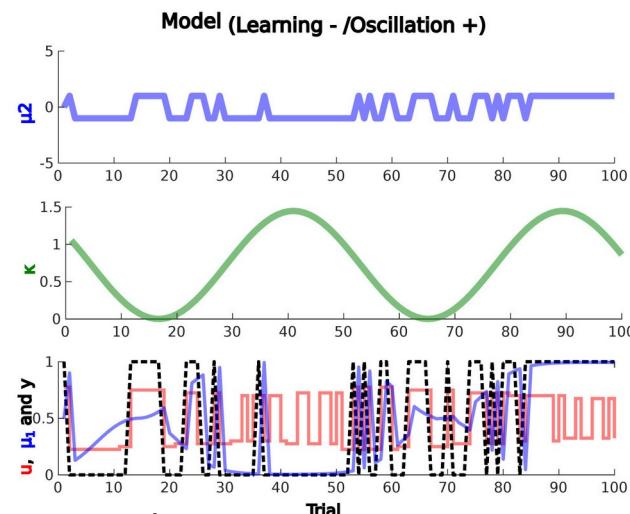

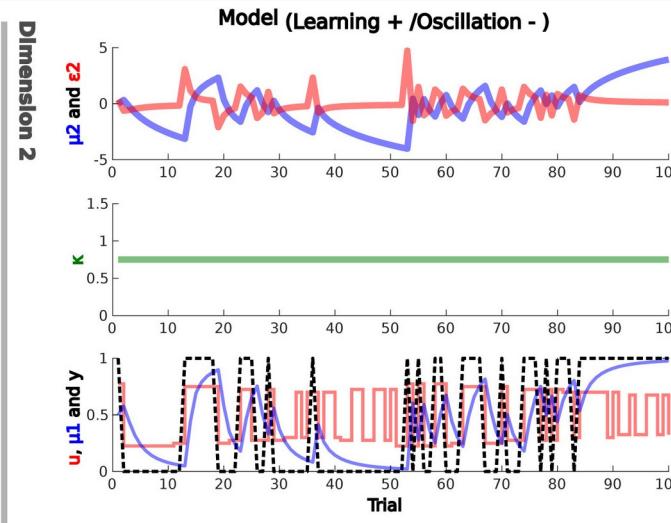

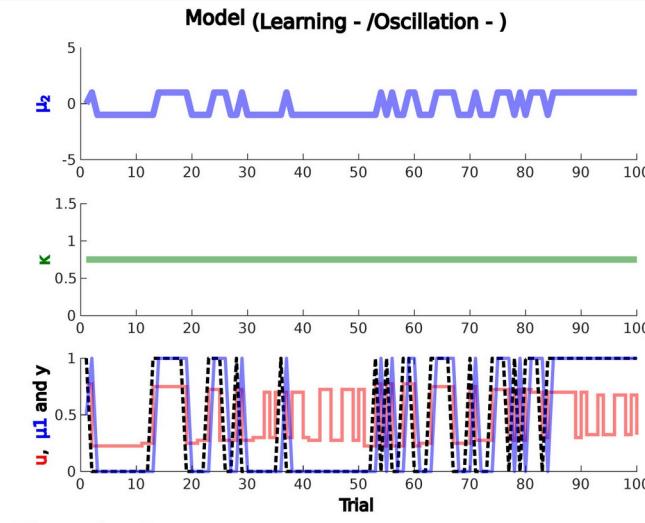

Bistable perception oscillates between internally- and externally-biased modes.

Duration: ~ 40 trials / ~ 3 min

## Dimension 1:

Are transitions to internal mode driven by accumulating effects of perceptual history?

## Dimension 2:

Are transitions between modes caused by systematic fluctuations in the effect of perceptual history on conscious experience?

# Computational Mechanisms

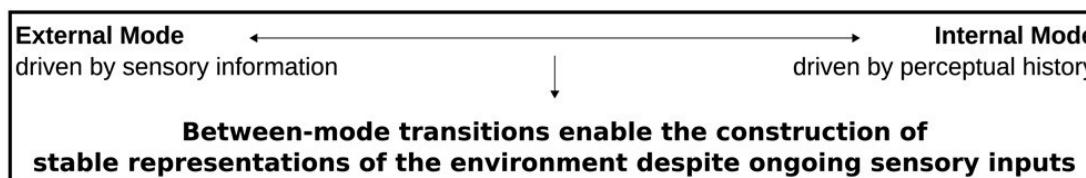

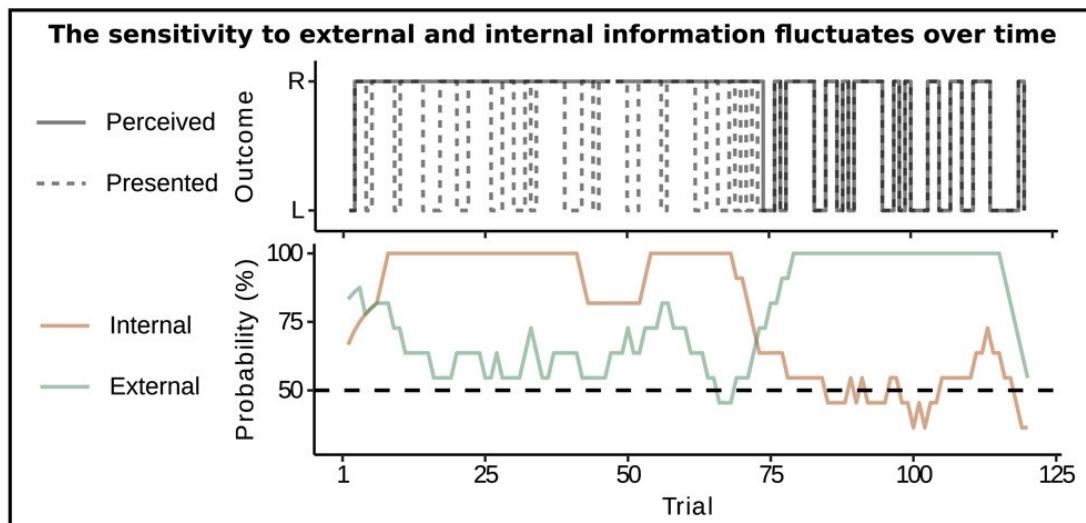

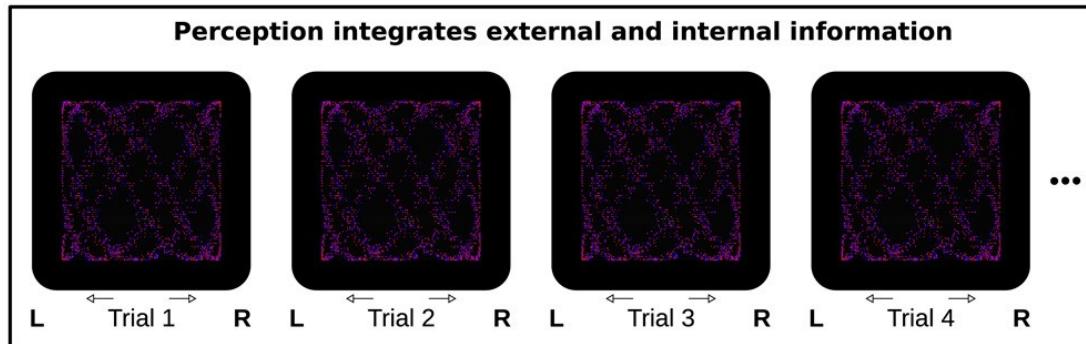

**Two factors:** Between-mode transitions are governed by systematic fluctuations in the impact of accumulating perceptual history.

**Credit assignment:** Learning stable internal representations despite ongoing sensory inputs (Honey et al. 2017).
